

# Swoopo Telebid - Bearbid Clones - 100% Functional Tested

[DOWNLOAD HERE](#)

Swoopo Telebid - BearBid Clones - 100 functional Tested This is not a hoax, this script that I cloned is 100 functional, has the same features plus a 9 templates. I remind you that you must copy the entire contents of the Catella UPLOAD, then: app, cake, vendors. Htaccess, index.php. Otherwise the script does not work .... INSTALLATION: Please note: For significant performance improvements, install Zend Optimizer on your server. Here are the instructions 1) Move the code (if it is not already) to a folder in your webroot folder. For example /var/www/swoopo2010. If you are moving this code to a live server, copy the code into the public\_html or httpdocs directory. 2) This step is only needed if the site isn't accessible from a domain name directly. e.g. swoopoclone.com You need to set up a subdomain to access the site, so that the website URL is swoopoclone.localhost For more information visit: [blog.ubrio.us/gnome/how-to-subdomain-localhost-ubuntu-osx](http://blog.ubrio.us/gnome/how-to-subdomain-localhost-ubuntu-osx) 3) The next step is to create your database and dump the SQL. In the code under /app/config/sql import the file databasebearbid1\_demo.sql into your database. 4) Now you need to create your config file. In app/config you will see a file called config.default.php. Rename this to config.php and fill out the details so that they match yours. Turn demoMode to true for now. 5) Now you need to chmod 777 the following directories: /app/tmp /app/tmp/cache /app/tmp/cache/models /app/tmp/cache/persistent /app/tmp/cache/views /app/webroot/img/category\_images /app/webroot/img/category\_images/max /app/webroot/img/category\_images/thumbs /app/webroot/img/auctions\_images /app/webroot/img/auctions\_images/max /app/webroot/img/auctions\_images/thumbs /app/webroot/img/files 6) Now you need to create the following Cron Jobs. We use CURL to access the URLs, but contact me if you server doesn't have CURL installed. These cron jobs should be set to run every minute, of every hour, or every day. Make sure the cronTime in the config is set to 1 also. The 4 commands you need to set up are: curl -s -o /dev/null domain.com/daemons/bidbutler curl -s -o /dev/null domain.com/daemons/extend curl -s -o /dev/null domain.com/daemons/autobid curl -s -o /dev/null domain.com/daemons/close If you are running the site on your local host, you can test these things by

simply running the daemons directly on another browser and set the cronTime to say 10 to keep it running. 7) You should now be able to access the website. Register on the website, and your account will be set to admin. Once you have done this, turn turn the demoMode back to false. Thats it! Enjoy the code! To access control panel to login as a normal user such as inputting data: user: administrator  
Password: administrator
