Search Engine Manifesto Rank Your Web Pages HIGH in TOP Search Engine Popular Results For Maximum Exposure! Search Engines and How They Work Search Engines are special sites on the Web that are designed to help people find information stored on other sites. There are differences in the ways various Search Engines work, but they all perform three basic tasks: They search the Internet - or select pieces of the Internet - based on important words, They keep an index of the words they find, and where they find them, and They allow users to look for words or combinations of words found in that index. Early Search Engines held an index of a few hundred thousand pages and documents, and received maybe one or two thousand inquiries each day. Today, a top Search Engine will index hundreds of millions of pages, and respond to tens of millions of queries per day. Before a Search Engine can tell you where a file or document is, it must be found. To find information on the hundreds of millions of Web pages that exist, a Search Engine employs special software robots, called spiders, to build lists of the words found on Web sites. **DOWNLOAD NOW FOR MORE INFO!**
